

Two Step Cleaning Protocol for Buttonhole Sites

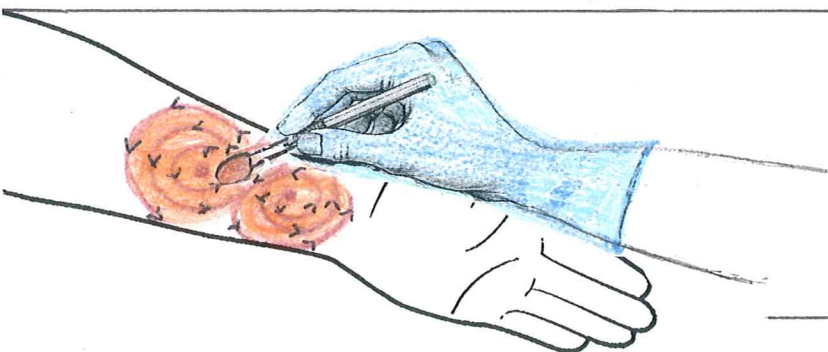

Have patient wash their access arm before coming to their dialysis chair.

Using your facility's antimicrobial agent, cleanse the buttonhole site, using a circular motion, starting from the center and working out. Do not drag the applicator back to middle from outside, this will contaminate your site.

Remove the scabs from the buttonhole sites using an appropriate technique.

Using your facility's antimicrobial agent, again cleanse the buttonhole sites using the same circular motion from site working outward. Leave the agent on according to manufacturer's recommendations.

Now you are ready to cannulate with your sterile needles.
